

Here's a balanced 4-person split based on the project requirements, so everyone carries a similar load and the work covers both coding and submission tasks. The project includes authentication, profile, feed, posts, likes/comments, follow/unfollow, localStorage data handling, GitHub collaboration, report, and demo video.

Equal 4-member division

Member 1 — Authentication + Data Model

Main tasks

- Build Register page
- Build Login page
- Add form validation
 - email format
 - password strength
- Manage current logged-in user
- Design the main JSON structure for:
 - users
 - posts
 - comments
 - likes
 - follows
- Set up localStorage save/load helpers

Why this is fair

This person handles a core system used by the whole app and the data foundation everything depends on. The PDF explicitly requires user authentication and storing data in localStorage as JSON.

Member 2 — News Feed + Posts

Main tasks

- Build the News Feed page

- Show posts from followed users
- Create new post feature
- Delete post feature
- View single post details
- Display timestamps properly
- Connect feed rendering to localStorage data

Why this is fair

This is a major chunk of the platform because the feed and posting system are central features. The PDF lists the feed plus create/delete/view posts as essential core features.

Member 3 — Profile + Follow System

Main tasks

- Build User Profile page
- Show user info and user posts
- Edit own profile
- Add profile picture handling
- Build Follow/Unfollow feature
- Update feed logic so followed users affect the feed
- Handle profile-related UI styling and responsiveness

Why this is fair

This combines another major feature area with relationship logic between users. The PDF requires user profiles and follow/unfollow support.

Member 4 — Likes/Comments + Final Integration + Submission Assets

Main tasks

- Add Like feature with count updates
- Add Comment feature

- Ensure comments show on post detail page
- Test persistence for likes/comments in localStorage
- Lead final integration testing across all pages

Why this is fair

Likes/comments are required features, and this role also owns quality control and deliverables, which matter in grading: report, demo recording, and GitHub collaboration all count toward marks.

Shared responsibilities for everyone

To keep it truly equal, each member should also do these:

- Make their own GitHub commits with clear messages
- Test at least one other member's feature
- Help with responsiveness using Flexbox/Grid
- Contribute to the report
- Appear in or help with the demo video

Suggested GitHub contribution rule

To make the work look evenly distributed:

- Each member should make **at least 8–12 meaningful commits**
- Each member should open or review at least one pull request or branch merge
- Do not let one person upload everything at the end

That matters because the rubric checks whether the GitHub history shows collaborative work and whether work was evenly distributed.

Simple timeline

Week 1

- Member 1: auth + localStorage structure
- Member 2: feed + create post
- Member 3: profile page + follow/unfollow

- Member 4: likes/comments

Week 2

- Connect all features together
- Fix bugs
- Improve responsive design
- Write report
- Record demo
- Final testing

Best practical rule

Nobody should own only “documentation” or only “styling.” Every member should have:

- one major coding feature
- one smaller support task
- one submission responsibility

That makes the split look fair and actually fair.

I can also turn this into a neat table you can paste directly into your report.
